PROFESSIONAL SUMMARY

B.Tech Engineering student at St. John College of Engineering and Management (SJCEM) with hands-on experience building AI-powered applications, full-stack software, and automation tools. Skilled in Python, Java, JavaScript, SQL, and Git, with experience participating in hackathons and developing practical projects involving machine learning, RAG systems, and web development. Strong problem-solving, rapid prototyping, and teamwork skills.

B.Tech Engineering in Artificial Intelligence and Machine Learning
Expected Graduation: 2028 | CGPA: 9.16/10

TECHNICAL SKILLS

- **Languages:** Python, Java, JavaScript, SQL, HTML5, CSS3
- **AI/ML:** Machine Learning, RAG, Streamlit, YOLO, Prompt Engineering
- **Databases:** MySQL, SQLite
- **Tools:** Git, GitHub, Microsoft Excel
- **Core Concepts:** OOP, Data Structures, DBMS, Responsive Web Design

PROJECTS

Local AI Assistant (Sainik Project)

Built a local AI-powered assistant that runs entirely offline using local language models, enabling secure document search, question answering, and information retrieval without relying on cloud services. Designed for privacy-sensitive environments with a Retrieval-Augmented Generation (RAG) workflow for fast and accurate responses from local documents.

AI Speaking Challenge (Not complete)
Built a real-time AI-powered speaking assistant using Whisper Large V3 Turbo for speech-to-text and Ollama-hosted local LLMs for response generation and conversational interaction. Implemented a local voice pipeline that converts speech into text, processes it through a language model, and generates intelligent responses, enabling interactive speaking practice while maintaining privacy through local AI processing.

Student Management System
Built a Python, MySQL, and Tkinter application supporting CRUD operations, attendance tracking, and academic record management for over 1,000 records.

Roomies — AI-Powered Accommodation Platform
Built an AI-driven accommodation platform designed to help students find suitable housing and compatible roommates. Developed intelligent matching and recommendation concepts based on user preferences, budget, location, and lifestyle compatibility, with a focus on simplifying the student accommodation search experience

HACKATHON EXPERIENCE

HACKATHON EXPERIENCE Rule or Ruin — Somaiya Vidyavihar 2nd Place | PRISM — AI-Powered Credit Scoring Platform Developed PRISM, an AI-driven credit scoring platform designed to assess borrower risk and improve lending decisions. Worked across React, TypeScript, Tailwind CSS, Node/NestJS, PostgreSQL, Redis, and Python ML. Collaborated with a team to ideate, develop, and present the solution under hackathon time constraints. **Achieved 2nd place among participating teams.**

LEADERSHIP & STRENGTHS

- Rapid Prototyping
- Problem Solving
- Team Collaboration
- Communication
- Leadership
- AI Product Ideation
